

JAN KING DAVE F. SALAS

Calauag, Quezon, Philippines | 09272056612 | jankingdavesalas@gmail.com
github.com/Jandave0

PROFESSIONAL SUMMARY

Highly analytical third-year Information Technology student with hands-on experience in full-stack web development, IoT systems architecture, and mobile applications. Successfully bridging hardware telemetry with scalable cloud backends. Applies deliberate, context-driven prompting practices with AI coding tools to accelerate development, going from basic prompting to structure the full context an AI assistant needs to produce reliable, production-ready code.

TECHNICAL SKILLS

- Programming Languages: Java, JavaScript, TypeScript, C++ (ESP32 Firmware)
- Frameworks & Libraries: React Native, Express, Prisma ORM
- Cloud & Databases: Supabase, MS SQL Server, n8n Automation
- Developer Tools: Git, GitHub, Vercel, Antigravity
- AI-Augmented Development: Gemini, Antigravity CLI, structured context engineering

PROFESSIONAL EXPERIENCE

Technical Intern — The Umonics Method

March 2026 – May 2026

- Developed and customized responsive WordPress web pages, optimizing layout designs and user interfaces to guarantee seamless cross-device compatibility.
- Managed plugin configurations and core content updates, auditing site assets to reduce page load latency and maintain platform security.

Data Operations & SLA Intern — Stellarsat Solutions Inc.

July 2025 – August 2025

- Completed a 300-hour technical internship specializing in mapping, MIR, service level agreements (SLA), and data operations.
- Analyzed and processed geographical data streams, ensuring high accuracy and compliance with operational service level agreements.

KEY PROJECTS

SolarX — IoT-Enabled Single-Axis Solar Tracking System

Technical Architect & Team Lead

- Designed and built a full-stack IoT architecture using an ESP32 microcontroller, TypeScript frontend, and Prisma ORM.
- Implemented wireless telemetry scraping and firmware for local data logging via I2C sensors to monitor PV harvest, battery status, and load consumption in real-time.
- Engineered an automated machine learning backend to provide predictive analytics on solar harvest safety and efficiency.
- Applied structured context engineering with Gemini CLI and Antigravity, feeding codebase architecture, requirements, and constraints as rich context rather than basic prompts, to accelerate feature development and reduce iteration cycles.

EDUCATION

Diploma in Information Technology — Polytechnic University of the Philippines (PUP), Lopez Campus

Expected Graduation: 2026

- Current Status: Third-Year Student
- Key Coursework: Software Engineering, Advanced Database Management, Mobile Application Development
